

Manual integration tests list

Rescue and snow conditions dividence (2)

In this project, payment system is not implemented yet and clients have not decided when to open this feature to user. Therefore, visually the application should remain the same as before and all users are premium users by default.

Test case 1: Features locked

Precondition:

User account is not granted access to snow condition and snow type definition features.

Procedure:

Open application from mobile/simulator

Open side menu

Try to use toggle button on top of the menu

Tap/Click on one of the locked features

Tap/Click on "go to User Information" from popup widget

Result:

Toggle button on top of navigation menu is visible

Snow condition and snow type definition features are visible by default with grey color and lock icon next to them.

Toggle button show/hide locked features (snow condition and snow type definition features) from menu.

Tapping on locked features opens popup widget

"go to User Information" button direct user to User Information page.

Test case 2: Feature unlocked

Precondition:

User account is granted full access to the application (all features enabled)

Procedure:

Open application from mobile/simulator

Open side menu

Try navigate to features from the menu, such as snow condition, weather in Pallas and snow type definition features.

Result:

Toggle button on top of navigation menu is hidden

All items from navigation menu are visible and accessible without being greyed out and locked

Tapping on items from navigation menu directs the user to intended pages.

Tutorial for mobile app (5)

*Tutorial step must follow what is documented in the following link
<https://snowledge2023.atlassian.net/wiki/x/CABgAQ>*

*Tutorial text box must display instruction in Finnish or English following description from
<https://snowledge2023.atlassian.net/wiki/x/AQBIAQ>*

Test case 1: Application opened the first time (English)

Precondition:

Application has just been installed and opened for the first time (All data and cache from previous session should be removed).

Procedure:

Open application from mobile/simulator

Choose English language and complete pre-setup

Follow the tutorial guide step-by-step

Result:

Tutorial should be displayed as specified in Confluence link attached in the beginning of this document. Language displayed is English.

Test case 2: Application opened the first time (Suomi)

Precondition:

Application has just been installed and opened for the first time (All data and cache from previous session should be removed).

Procedure:

Open application from mobile/simulator

Choose Suomi language and complete pre-setup

Follow the tutorial guide step-by-step

Result:

Tutorial should be displayed as specified in Confluence link attached in the beginning of this document.
Language displayed is Finnish.

Test case 3: Application opened the first time (Skipped function)

Precondition:

Application has just been installed and opened for the first time (All data and cache from previous session should be removed).

Procedure:

Open application from mobile/simulator

Choose a language and complete pre-setup

Follow the tutorial guide step-by-step

Randomly select skip tutorial at any step

Try to continue next step in the tutorial to verify

Result:

Tutorial should be displayed as specified in Confluence link attached in the beginning of this document.
Language displayed is according to selection. After choosing to skip tutorial, tutorial should not be shown anymore.

Test case 4: Application opened the second time

Precondition:

Application is opened the second time and onward. (User data and application data was created).

Procedure:

Open application from mobile/simulator

Try switch between pages and open random windows.

Result:

Tutorial should not be displayed.

Test case 5: Application opened the first time (depart from tutorial)

Precondition:

Application has just been installed and opened for the first time (All data and cache from previous session should be removed).

Procedure:

Open application from mobile/simulator

Choose a language and complete pre-setup.

Follow tutorial until step 4 ("Tap here to share location")

Open side menu and select random link.

Return to main page and tap on ask for help

Close ask for help window.

Continue tutorial from previous step until step 7 ("Tap here to send a new help request")

Close/Shutdown application. (Application is not running in background but shutdown entirely)

Reopen application

Continue tutorial from previous step until the end.

Result:

Tutorial should be displayed as specified in Confluence link attached in the beginning of this document. Language displayed is according to selection. When departing from official step guidance, it should be possible to continue from where it was left off. Other functionalities in the application should not be affected by tutorial departing.

Compass on map (1)

Test case 1: Normal use case

Precondition:

Application is running normally with connection to map service.

Procedure:

Open application from mobile/simulator

Open map view from side menu

Try to rotate, moving and zooming the map so that it is different from initial state.

Tap on compass button.

Repeat step 3 and 4 several times.

Tapping on current location button to return the map position to current location.

Result:

Compass button should be visible and look similar to the following design. At initial position, compass icon should be in upright position where red part pointing upward.

When rotating the map, compass icon should be rotated at the same angle as the map. The response time should be immediate without any visible delay. When rotating the mobile phone, the location pin direction should point to the real direction that the phone is heading to.

When tapping on the button, the map should be reset to initial angle (default angle) and button icon changed to the other one with red arrow pointing upward and letter 'N' for 1 second and then changed back to default compass icon.

When tapping on the current location button, the compass icon should be rotated according to the current rotation angle of the map.

Snow API sensors on React map (1)

Test case 1: Normal use cases

Precondition:

SnowAPI connection is established.

Procedure:

Open application from mobile/simulator

Open Snow condition page from side menu

Try to zoom in and out on the map to locate the sensors' position.

Tapping on the sensors' pin icon on map to view sensors details.

Tapping on the sensors visibility button

Tapping on other sections and Hotel Pallas pin.

Result:

Sensors locations and sensors visibility button should be visible with similar UI as follow:

When tapping on the sensors location pin, there should be text box displayed with detailed about snow depth and temperature. Only one text box should be displayed at one time. When tapping on other UI elements, currently opened box should be hidden.

When tapping on the sensors visibility button, the button icon should change to the other one and sensors location pins' visibility should be adjusted accordingly (either hide or show).

The sensors location UI implementation should not affect other functionality of the Snow condition map.
