1 Introduction

1.1 Purpose and scope of document

This document is intended to report what kinds of tests were used in developing the Snowledge app. Since our development faced errors of such magnitude that actual code was not implemented into a successful deployment, our testing will be very limited and focus mostly on customer satisfaction with the documentation we wrote about the application for them and the next groups that will develop this application.

1.2 Product and environment

The Snowledge mobile app and rescue website, are made in Flutter, so written in Dart, while the main website (lumisovellus.fi) is made using React, so written in JavaScript.

All Snowledge code is currently in Gitlab, and we tried moving parts of it to Github to increase the amount of possible participants in the project. Due to issues we faced, which are expanded upon in the next chapter, we were unable to deploy the app from the Github repository, so Gitlab still remains as the main repository. We pushed the documentation describing the application into the Github repository for the use of future groups and the customer. The document is considered to be the main product of our project.

The application is hosted on a Tavu.io server using a Ubuntu virtual machine.

1.3 Project constraints related to testing

During the development of the application, there were multiple issues we faced, which eventually prevented development of the app further. The main issue was with the Flutter packages previous groups had used in development. Some of them were deprecated or removed from use, so developing the application further would have required us to upgrade the packages and replace the deprecated code. On top of this issue, there were conflicts between the packages, and these issues were so pervasive that development and deployment were eventually scrapped, as fixing these issues took longer than expected, and eventually all the issues were not possible to fix with our skillset and available time. Due to these issues, we do not have a deployed application to test, and instead we will consider the guide document describing the application and the issues to the customer and next developers as our product. Therefore, the testing success is measured as customer satisfaction with this document.

2 Testing process

2.1 General approach

The strategy for testing was recursive development of the documentation for the application. The customer was asked for feedback and ideas on the topics, structure and contents of the document during the writing process to guide the document into a desirable direction. The customer acceptance test will be the final review, where they will be able to review the document and decide whether it is appropriate for their use or not.

2.2 Testing roles

Aarni – Customer communication and writing test report.

Fahid – Project management and guiding the document writing.

Juuso and Arto – Customers, end-users.

2.3 Test schedule

Testing is considered to have started on 22.11.2024, when the need for good documentation was discussed, and the group decided with the customer on a general outline of the documentations purpose and content. On 27.11. the customer was contacted and given updates on the documentation progress. The customer was asked for feedback on 29.11. during the sprint 5 review. The finalised document was accepted and delivered to customer on 9.12., during which they decided that the documentation is in a ready state from their view. This is considered the ending time for testing.

Since testing is related to customer communication in our case, the time is counted in the amount of time the issue was discussed with the customer in meetings, which amounts to a total of $1.5 + 0.33 + 0.5 + 1 = 3.33\text{h}$

3 Test results

The customer wanted us to write the document with the ground rule of “what would you have liked to see as a new developer group”. This was achieved by making comprehensive documentation on the basic working of the application, its structure, the tools needed and the main issues in the current application. In later meets, there was also a need expressed for a documentation for the customer, so that they can have a better understanding of the application and can make better decisions in the future based on this. Clarity and simplicity were the focus here, and this was achieved by writing a separate part of the documentation in less tech-heavy language for the customer.

In the 29.11. meet, the customer was satisfied with the direction of the document and accepted the guide document on 9.12. The finalised document was delivered to the customer on 9.12.
